Dear Hiring Manager,
My name is Harsh Patil, and I am currently in my second year of Computer Science. I came across the Junior Software Developer opening on your careers page and felt it could be a great starting point for me. While I don't yet have much formal work experience, I am enthusiastic about learning and motivated to contribute wherever I can.
During my studies, I have focused on programming with Python, Java, and C++. Alongside coursework, I have built small projects such as a calculator, a student database, and a basic website. These projects may not have been advanced, but they gave me practice in writing code, fixing errors, and thinking through problems step by step. I also completed a short internship where I worked with a small team to create a simple web tool. That experience taught me the importance of meeting timelines, collaborating with others, and staying patient while debugging.
Beyond academics, I like improving my skills independently. I often explore coding practice websites or try building small tools just for fun. For example, I recently created a Python-based attendance tracker as a side project. Even though it was simple, it gave me a sense of achievement and showed me how rewarding it is to turn an idea into something that actually works.
I know I am still at the early stage of my career, but I am eager to learn quickly, open to feedback, and willing to put in the effort to grow. I am looking for an opportunity where I can start applying what I have learned, gain new knowledge from experienced developers, and gradually develop into a capable software professional.
Thank you for considering my application. I would be grateful for the opportunity to discuss this role further in an interview.
Sincerely,
Harsh Patil
